

EMMA SCRIPT

EMMA SCRIPT is the next generation of Electronic Medical Records and integrates the latest digital pen technologies into a highly advanced web based, online medical records system.

Overview

Using Anoto Pen technology, EMMA Script allows your clinicians and patients to fill out real paper forms using a real pen and have the text instantly read, interpreted and uploaded into the patient clinical record.

EMMA Script reads clinicians' and patients' handwriting and turns the hand written script into real clinical data.

The original text is stored electronically allowing you to be certain that accurate clinical data has been retained at all times

Benefits

- Eliminate the need for scanning of handwritten clinical notes
- Dramatically improve doctor patient interaction without losing the benefit of Electronic Medical Records
- Import live data from all clinicians, irrespective of their location
- Eliminating the need for PCs during consultations.
- Forms filled out by patients uploaded to administrative system automatically.
- Cost effective

Case Study

In Physiotherapy, the hardest part of performing the consultation (after the diagnosis of course) is making a record in a PC without compromising on patient care. EMMA Script allows the physio to simply fill out a basic 'front sheet' and actually draw on a real body in a way that is totally natural. The data is then instantly uploaded and stored electronically on the EMMA clinical system.

EMMA SCRIPT links to the outcomes tracking system in EMMA allowing the physio to instantly track improvements and the clinical directors to monitor performance in aggregate as well as pick out difficult cases for further discussion, all without any of the physios actually touching a computer.
